Appendix: Test Environment Details	8

Executive Summary

Testing covered product browsing, search, account access, currency selection, and the full add-to-cart through checkout flow. The application is functional for core browsing and shopping behavior, with search and product discovery performing reliably under both normal and edge-case input.

Two Critical findings were identified directly in the purchase path: the checkout Grand Total includes a consistent, unexplained \$100.00 discrepancy above the correct Subtotal plus Shipping calculation, and the mandatory Country field on the billing form cannot be successfully selected, which blocks every customer from completing checkout regardless of browser or input. Either issue on its own would justify holding a release; together they represent a complete stop in the revenue path and should be treated as the top priority before any further work proceeds.

A High-severity finding was also identified in account sign-in, which does not authenticate or provide validation feedback under any tested input. The remaining findings are content, visual, and minor functional issues that affect polish and trust but do not block core transactions.

Scope of Testing

The following areas and functionality were included in this engagement:

- Product catalog browsing and product detail pages
- Product search (positive and negative/no-match queries)
- Account access (sign in, new user panel)
- Currency selection control
- Shopping cart (add to cart, quantity update, cart totals)
- Checkout flow through billing details entry

The following were explicitly out of scope for this engagement:

- Account creation / new user registration flow
- Shipping method selection and payment submission (checkout could not be reached due to F-07)
- Mobile and tablet viewport testing
- Cross-browser testing beyond Chrome

Coverage Summary

A breakdown of testing activity performed against each area in scope:

Area Tested	Checks Performed	Pass	Fail	N/A	Notes
Product Catalog & Listings	6	5	1	0	<i>Image enlarge</i>
Product Search	2	2	0	0	<i>Pass + no-match</i>

Account / Sign In	3	0	2	1	See findings
Currency Selector	2	0	2	0	Multiple pages
Shopping Cart	2	1	1	0	Total math
Checkout — Billing Details	3	2	1	0	Country field

Findings

Each issue identified during testing is documented below with severity, reproduction steps, and supporting evidence. Severity definitions:

- Critical — Application is unusable, data loss, or core function completely broken.
- High — Major function impaired with no reasonable workaround.
- Moderate — Function impaired but a workaround exists, or issue is cosmetic but highly visible.
- Minor — Small, low-impact issue, edge case, or polish item.

Findings are presented in the order discovered. F-06 and F-07 (Critical) are the highest-priority items in this report.

Finding F-01 — Untranslated Russian Text on Account Page

Finding ID	F-01
Title	Untranslated Russian Text on Account Page
Severity	Minor
Area / Page	Account / Sign In page — New User panel
Environment	Chrome (Windows), Desktop, USD locale
Steps to Reproduce	1. Navigate to the Account / Sign In page. 2. Locate the “New User” panel on the right side of the page. 3. Observe the hyperlink text directly under the “New User” heading.
Expected Result	All visible page text should be in English, consistent with the rest of the site.
Actual Result	The link text reads “Не зарегистрированы? Нажмите кнопку ниже” (Russian for “Not registered? Click the button below”) instead of the expected English copy.
Evidence / Notes	Confirmed via direct page inspection; text renders in Russian on every page load.

Finding F-02 — Sign In Button Does Not Authenticate or Validate

Finding ID	F-02
------------	------

Title	Sign In Button Does Not Authenticate or Validate
Severity	High
Area / Page	Account / Sign In page — Returning Customer panel
Environment	Chrome (Windows), Desktop
Steps to Reproduce	1. Navigate to the Account / Sign In page. 2. Leave Email Address and Password fields empty, click Sign In. Observe no validation message appears. 3. Re-enter a validly formatted email and password, click Sign In again.
Expected Result	Submitting empty required fields should display inline validation errors. Submitting valid-looking credentials should attempt authentication and either log the user in or return a credentials-related error.
Actual Result	In both cases, clicking Sign In performs no authentication attempt, shows no field-level validation, and does not navigate. The action appears to have no effect on page state regardless of input.
Evidence / Notes	Reproduced on 3 separate attempts, both empty and populated field states.

Finding F-03 — Currency Selector Does Not Retain Selection

Finding ID	F-03
Title	Currency Selector Does Not Retain Selection
Severity	Moderate
Area / Page	Sidebar — Select a Currency control (site-wide)
Environment	Chrome (Windows), Desktop, tested on Store and Product Detail pages
Steps to Reproduce	1. On any store or product page, locate the “Select a Currency” dropdown (default: USD). 2. Select “EUR” from the dropdown. 3. Observe the dropdown value and any visible product prices on the page.
Expected Result	Selecting a different currency should update the dropdown to reflect the new selection and convert displayed prices accordingly.
Actual Result	The dropdown reverts to displaying “USD” immediately after selection. No price conversion is applied anywhere on the page. Reproduced with both EUR and GBP selections across multiple pages.
Evidence / Notes	Verified against a fixed-price reference item (Silver Heart Bracelet, \$275.00 USD) with no change after currency selection.

Finding F-04 — Product Image Does Not Enlarge on Click

Finding ID	F-04
Title	Product Image Does Not Enlarge on Click
Severity	Minor
Area / Page	Product listing and product detail pages
Environment	Chrome (Windows), Desktop
Steps to Reproduce	1. Navigate to the Find Bugs product listing page. 2. Click directly on a product thumbnail image (e.g. Dark Grey Jeans). 3. Observe page behavior.
Expected Result	Clicking the product image should enlarge it or open an expanded/lightbox view for closer inspection.
Actual Result	Clicking the image produces no visible change. No lightbox, zoom, or expanded view appears.
Evidence / Notes	Reproducible on repeat clicks across multiple product images.

Finding F-05 — Inconsistent Button Styling on Account Page

Finding ID	F-05
Title	Inconsistent Button Styling on Account Page
Severity	Minor
Area / Page	Account / Sign In page
Environment	Chrome (Windows), Desktop
Steps to Reproduce	1. Navigate to the Account / Sign In page. 2. Compare the styling of the “Sign In” button (Returning Customer panel) against the “Create Account” button (New User panel).
Expected Result	Both buttons perform comparable account-related actions on the same page and would be expected to share consistent visual styling per standard UI conventions.
Actual Result	The Sign In button uses a blue/teal fill while the Create Account button uses a solid black fill, creating a visual inconsistency between two functionally similar calls to action.
Evidence / Notes	Visual comparison captured on the same page, same viewport.

Finding F-06 — Checkout Grand Total Includes Unexplained \$100.00 Discrepancy

Finding ID	F-06
Title	Checkout Grand Total Includes Unexplained \$100.00 Discrepancy

Severity	Critical
Area / Page	Shopping Cart and Checkout — Billing Details page
Environment	Chrome (Windows), Desktop, USD
Steps to Reproduce	1. Add “DNK Yellow Shoes” (\$45.00) to cart, quantity 1. Open the cart. 2. Note Cart Subtotal (\$45.00) and Shipping (\$7.99). Note the Grand Total. 3. Update quantity to 2. Note the recalculated Subtotal (\$90.00) and the new Grand Total. 4. Proceed to Checkout Details and confirm the Grand Total displayed in the order summary sidebar.
Expected Result	Grand Total should equal Cart Subtotal plus Shipping, with no additional unexplained charges (Qty 1: \$52.99. Qty 2: \$97.99).
Actual Result	Grand Total displayed \$152.99 at quantity 1 and \$197.99 at quantity 2 — in both cases exactly \$100.00 higher than Subtotal plus Shipping. The discrepancy is consistent and reproducible, and carries through unchanged into the Checkout Details page.
Evidence / Notes	Confirmed at two different quantities with the same \$100.00 offset both times, indicating a systematic calculation error rather than a one-off display glitch.

Finding F-07 — Country Field Cannot Be Selected, Blocking Checkout Completion

Finding ID	F-07
Title	Country Field Cannot Be Selected, Blocking Checkout Completion
Severity	Critical
Area / Page	Checkout — Billing Information
Environment	Chrome (Windows), Desktop
Steps to Reproduce	1. Proceed to Checkout Details with an item in the cart. 2. Click the Country dropdown (marked mandatory) and select “United States.” 3. Observe the dropdown's displayed value. 4. Complete all other required billing fields and click “Continue to Shipping.”
Expected Result	Selecting a country from the dropdown should update the field to show the selected country, and a fully completed form should allow the customer to proceed to the shipping step.
Actual Result	The Country field reverts to displaying “Select a Country” immediately after a selection is made, on every attempt. Because the field never registers a value, clicking “Continue to Shipping” triggers the form's own validation (“Please select your Country”) and blocks all further progress. No customer can complete checkout under any circumstance while this persists.

Evidence / Notes	Reproduced 2 separate times with identical results. Form validation itself functions correctly and correctly identifies the field as empty — the defect is isolated to the dropdown's selection mechanism, not the validation logic.
------------------	--

Issues Unable to Be Reproduced

No issues encountered during this engagement fell into this category. Every observed anomaly was successfully reproduced at least twice before being logged as a finding above.

Recommendations & Next Steps

Prioritized guidance on what to address before proceeding:

- Treat F-06 and F-07 as release blockers. Investigate the Country dropdown's selection-binding logic and the Grand Total calculation immediately — together they prevent any customer from completing a purchase.
- Restore Sign In functionality (F-02) and add proper field-level validation feedback; this is core account functionality with no current workaround.
- Fix or remove the Currency Selector (F-03) until conversion logic is implemented — a non-functional control that appears functional is worse than no control at all.
- Address the remaining content, visual, and polish items (F-01, F-04, F-05) as time allows; none are blocking but all are visible to every customer.

Appendix: Test Environment Details

Full environment and configuration details used during testing:

- Browser: Google Chrome (latest), Windows 10/11
- Viewport: Standard desktop resolution
- Test data: Synthetic test account details (e.g. tester@example.com); no real customer or payment data used
- Tools used: Manual browser interaction, direct page inspection
